

WHAT IS CLAIMED IS:

1. A document holder comprising

a plurality of holder bodies each having an adapting part, and the holder bodies mounted to one another in a vertical direction;

5 a shaft assembly arranged in the adapting part of the bottommost holder body, and the shaft assembly having a first pivot part formed on a top thereof in the vertical direction; and

a plurality of pivot modules respectively connecting to the holder bodies except the bottommost holder body, wherein each pivot module has a second
10 pivot part at a top thereof and a matching part at a bottom thereof in the vertical direction;

wherein the first pivot part of the shaft assembly and the second pivot parts of the pivot modules pivotally connect to the matching parts of the pivot modules adjacent to one another, so as to form a vertical pivot shaft for enabling
15 the holder bodies to rotate in a horizontal direction.

2. The document holder of claim 1, wherein the first pivot part of the shaft assembly and the second pivot parts of the pivot modules are protruding columns, and the matching parts of the pivot modules are concaves.

3. The document holder of claim 1, wherein each holder body has a base
20 plate, a rear plate upwardly extending from a rear side of the base plate; the adapting part has a recess on an outer surface of the rear plate, a pair of opposite rails and a pair of opposite frames arranged along a vertical direction of the recess, and an opening adjacent to a bottom end of the recess; the shaft assembly has a first supporting arm, the pivot modules each having a second supporting

arm, the first and second supporting arms being accommodated in the recess via the opening of the adapting part, the first supporting arm having a pair of opposite first tracks and a pair of opposite first grooves to match the rails and the frames of the adapting part, and each second supporting arm having a pair of opposite second tracks and a pair of opposite second grooves to match the rails and the frames of the adapting part.

4. The document holder of claim 3, wherein each rear plate has a strip at a top thereof to correspond to the opening, two lateral plates upwardly extended from two opposite sides of the base plate; the two lateral plates each has at least one flange formed at a periphery thereof and at least one slot being formed at a bottom periphery thereof to correspond to the flange; each pivot module has a pivoting body on which the second pivot part is mounted, the matching part being formed under the pivoting body, the pivoting body having a height greater than the sum of the heights of the rear plate and the strip and also greater than the sum of the heights of the lateral plate and the flange.

5. The document holder of claim 3, wherein each holder body has an indentation at a front thereof.

6. The document holder of claim 1, wherein the shaft assembly has a receiving part formed at a bottom thereof in the vertical direction for enabling the document holder to mount on a fastener through a top portion of the fastener pivotally connects to the receiving part.
